USER STORIES AND TASKS

iGugulam Community Programme | Individual Agile Portfolio | Tlangelani Chauke

Project began	**Team**
13 July 2026	Tlangelani Chauke, Lungela Nkunkuma and Templeton Dyanti

1. Purpose and task ownership

These user stories describe the intended functions of the iGugulam website and break them into practical development tasks. They are portfolio formulations based on the project features; the supplied Trello screenshots confirm that a shared “Create website user stories” card was tracked during 6–8 August 2026 with checklist 6/6, but do not show the original wording of individual stories.

All three members participated in planning and each developed the frontend, backend and database components of their own allocated features. My allocated features were Dashboard, Announcements, Homework and Manage Announcements. I also led the Trello board. The other members’ specific feature allocations are not independently verified here.

2. My assigned feature user stories

US01 Dashboard

As a Programme user, I want to view a dashboard so that I can find and navigate the main website functions.

Tasks

- Create Dashboard page structure and layout
- Implement navigation to available modules
- Connect any required feature data through backend/database
- Check layout and navigation

US02 Announcements

As a learner or parent, I want to view announcements so that I can stay informed about programme updates.

Tasks

- Create Announcements page interface
- Connect announcement retrieval to relevant backend/database
- Display available announcements
- Check announcement display and usability

US03 Homework

As a learner, I want to view homework information so that I can keep track of learning activities.

Tasks

- Create Homework page interface
- Connect relevant homework data where available
- Present homework details clearly
- Check page behaviour

US04	Manage Announcements

As an administrator, I want to manage announcements so that I can keep programme information current.

Tasks

- Create Manage Announcements interface
- Implement relevant create/edit/delete actions as supported by code
- Connect supporting backend/database operations
- Test permitted management actions

Acceptance criteria for US01–US04 *(proposed, to be checked against implementation): the feature is navigable, displays the intended information, and relevant data actions work where implemented.*

3. Shared project user stories

ID	User story
US05	As a learner, I want access to educational resources so that I can improve my academic performance.
US06	As a parent, I want access to programme information so that I can support my child's education.
US07	As an administrator, I want an organised system so that I can manage educational support activities.

Shared planning participants for US05–US07: Tlangelani Chauke, Lungela Nkunkuma and Templeton Dyanti. Implementation was divided by individual feature ownership.

4. Evidence from Trello

Figure 1. Original cropped Trello Sprint 4 evidence.

Sprint 4 shows "Create website user stories" dated 6–8 August 2026, checklist 6/6; "Create website wireframes" dated 28–31 July, checklist 6/6; and "Design website UI" started 1 August, checklist 10/10. These are shared group cards, not evidence that I authored every checklist item.

5. Personal STAR reflection

Situation

Our three-member team needed to turn the educational website requirements into understandable user stories and actionable development tasks.

Task

I needed to contribute to user-story planning, manage Trello tracking and develop my own Dashboard, Announcements, Homework and Manage Announcements features.

Action

I used the shared planning records to understand user needs and organise tasks. I focused on frontend, backend and database work relevant to my own features, while Lungela and Templeton developed their respective features.

Result

The user-story approach helped connect user needs with development activities and made responsibilities clearer. I gained experience in Agile planning, Trello coordination and feature ownership.

6. Evidence and verification notes

The story wording, proposed tasks and acceptance criteria above are portfolio drafts. Confirm each implementation and test claim against screenshots, source code, commits or running pages before final submission. Trello screenshots demonstrate team planning and tracking, not individual code authorship.
